

Micro-Current Facelift

This non-surgical Micro-Current Facelift uses a gentle form of electro-stimulation to revitalize skin and muscle tissue. Then it uses micro-currents applied to the skin surface that stimulate the tissue on both a cellular and muscular level. This enhances blood circulation and encourages inter-cellular exchange to improve the skin's nutrition, waste removal and overall health and vitality. Contracted muscles (wrinkles), and relaxed muscles (slackened tissue) will be re-educated to their normal size to affect a complete non-surgical facelift.

Facial exercises are not enough to thoroughly target the correct muscles found responsible for wrinkling. Alone, Micro-Current can provide tremendous results.

When combined with other skin rejuvenating modalities such as LED Light Therapy, Progressive Skin Peels, HydraFacial or Microdermabrasion, the change is dramatic. The best results are realized when performed according to the recommended treatment program.

Micro-Current is unique because no other aesthetic treatment program can address underlying slackened muscles.

BENEFITS

- Firms and tightens skin
- Improves the look of prematurely aged skin
- Increases blood flow to skin and muscles
- Tones facial muscles
- Appreciably reduces fine lines and wrinkles
- Complement to a surgical facelift procedure and injectables*
- Alternative to cosmetic surgery

**Micro-Current is recommended 30 days post injectable treatment*
